Optional equipment

- 2nd circuit kit (code 074011) for connecting 2 heating circuits.
- Regulation extension kit (code 075311)
 to manage a 2nd heating circuit, swimming pool etc...
- **Boiler connection kit** (code 073990) for connecting a boiler to the heat pump.
- Electrical back-ups kit (code 073985).
- Room thermostat T37 (code 075308),
 Room thermostat T55 (code 073951),
 Room thermostat radio T58 (code 075313)
- for correcting the ambient temperature.
- Room control unit T75 (code 073954),
 Room control unit radio T78 (code 074061)
 for correcting the ambient temperature and programming the heat pump.
- Anti-vibration blocks (code 523574).
- White PVC floor support (code 809532) or Black rubber floor support (code 809536).
- Swimming pool kit (code 074726).
- Cooling kit (code 075312).
- High flow rate circulating pump kit (code 074067) for the installation of 1 circuit floor heating (with model > 13 kW).

Scope of application

This heat pump provides:

- Heating in winter,
- Control of two heating circuits*,
- Production of domestic hot water.
- Installation with boiler connection* as a supplementary heating for the coldest days.
- the addition of electrical back-ups*, for extra heating on the coldest days.
- Cooling in summer* (for floor heating-cooling system or fan-convectors).
- Heating the swimming pool*.
- * : These options require the use of additional kits (see para "Optional equipment").

1 Description of the unit

1.1 Package

• 1 package: Outdoor unit.

• 1 package: Hydraulic unit and outdoor sensor.

1.2 Definitions

- <u>Split</u>: The heat pump consists of two elements (an outdoor unit for outdoor and a hydraulic unit for inside the dwelling).
- <u>Air/water</u>: The surrounding air is the energy source. This energy is transmitted to the water in the heating circuit by the heat pump.
- Inverter: the fan and compressor speeds are modulated according to the heating requirements. This technology enables you to save on energy and operate on a singlephase power supply, whatever the heat pump's output, by avoiding heavy intensities on start-up.
- <u>COP</u> (coefficient of performance): this is the relationship between the energy transmitted to the heating circuit and electrical energy consumed.

1.4 Description

Legend:

- 1 Low-noise, high-output coil.
- 2 Electric variable speed "inverter" motor.
- 3 "Inverter" control module.
- 4 Vacuum start (pump down) and control light.
- 5 Connection terminal blocks (power and interconnection).
- 6 Refrigerant accumulator bottle.
- 7 Cycle reversing valve.
- 8 Anti-corrosion treated bodywork.
- 9 Electronic expansion valve.
- 10 Noise and temperature insulated "inverter" compressor.
- 11 Refrigeration connection valves (flared connectors) with protective caps.
- 12 Holding tank with condensate drain hole.
- 13 High-performance exchange surface evaporator; anti-corrosion treated hydrophilic aluminium fins and grooved copper tubes.

figure 6 - Outside unit components

figure 7 - Hydraulic unit components

1.5 Operating principle

The heat pump transmits the energy contained in the surrounding air into the dwelling to be heated.

The heat pump consists of four main elements, in which a refrigerant fluid (R410A) circulates.

- In the evaporator (ref. **13**, figure 6, page 9): The energy is taken from the surrounding air and is transmitted to the refrigerant. Because it has a low boiling point, it changes from the liquid state to the vapour state, even in cold weather (down to -15 °C outdoor temperature).
- In the compressor (ref. 10, figure 6, page 9):
 The vaporised refrigerant brought to high pressure and takes on more calories.
- In the condenser (ref. **15**, figure 7) : The energy in the refrigerant is transmitted to the heating circuit. The refrigerant returns to liquid state.
- In the expansion valve (ref. **9**, figure 6, page 9): The liquefied refrigerant is brought back to low pressure and returns to its initial temperature and pressure.

The heat pump is equipped with a controller, which controls the room temperature based on the outdoor temperature measurement and governed by the temperature control. The room thermostat (option) provides a corrective action for the temperature control.

The hydraulic unit can be optionally fitted with an electrical back-up system or boiler connection which starts up in order to provide additional heating during the coldest periods.

Regulation functions

- The heating circuit's initial temperature is controlled by the temperature control.
- The power of the outdoor unit is modulated according to flow heating temperature via the "inverter" compressor.
- Control of the electrical back-up heating (option).
- The daily timer program enables you to define the periods for comfortable or reduced ambient temperature.
- Summer/winter mode switchover is automatic.
- Control of the supplementary boiler* (option).
- The room thermostat (option)*: provides a corrective action for the temperature control.
- Control of a second heating circuit*.
- Domestic hot water: Heating time programme, control of the operation of the DHW circulation pump.
- Managing the cooling*.
- Control of swimming pool heating*.
- * If the heat pump is equipped with optional equipment and the associated kits.

Protection functions

- Anti-legionella cycle for domestic hot water.
- Anti-corrosion protection with titanium anode (ACI).
- Frost protection, DHW,...

• Domestic hot water (DHW) operating principle

Two domestic hot water (DHW) temperatures can be parametered: nominal temperature (line 1610 to 55 °C) and reduced temperature (line 1612 to 40 °C).

The default heat pump program (line 560, 561 and 562) is set for nominal temperature from 0h00 to 5h00 and from 14h30 to 17h00 and for reduced temperature for the rest of the day. This optimizes electrical consumption while ensuring comfortable availability of hot water.

Setting for reduced temperature can be useful to prevent the DHW from switching on too often and for too long during the day.

The production of domestic hot water (DHW) is triggered when the temperature in the tank falls 7°C (setting from line 5024) below the set temperature.

The heat pump produces the domestic hot water, which is then additively heated, if required, by electrical back-up heating inside the tank. To ensure a DHW setting over 45°C, the electrical back-up heating or the boiler must be left on.

Depending on how the parameter (1620) is set, nominal temperature can be reached 24h/day or only at night or depending on the heat pump programme.

The production of DHW takes priority over heating; nevertheless the production of DHW is controlled by cycles that control the times assigned to the heating and the production of DHW in the event of simultaneous demand.

A function to switch from "reduced" to "nominal" is provided on the front of the user interface. (see ref. 1, figure 31, page 30).

Anti-legionella cycles can be programmed.

• Fan convectors with integrated control system

Do not use a room sensor in the area.

figure 8 - Heat pump operating principle

2 Installation

2.1 Regulation installation and maintenance conditions

The appliance must be installed and the maintained by an approved professional in accordance with the prevailing regulations and code of practice, in particular:

- The legislation on the handling of refrigerants.
- Heating installation with floor heating system.
- Low voltage electrical installations Rules.

2.2 Unpacking and reservations

2.2.1 Receipt

Carefully check, in the carrier's presence, the general appearance of the appliances and check that the outdoor unit is not laid on its side or back.

In the case of any dispute, state any appropriate reservations to the carrier in writing within 48 hours and send a copy of this letter to the After-Sales service.

2.2.2 Handling

The outdoor unit should not be laid on its side or back during transport.

If not kept upright during transport, the appliance could be damaged through displacement of the refrigerant and deformation of the compressor suspension.

Any damage caused by transportation of the unit lying down is not covered by the warranty.

If necessary the outdoor unit may be tilted only during manual handling (to go through a door or use a staircase). This operation must be conducted very carefully and the appliance must be immediately restored to upright position.

2.2.3 Containment of refrigerant circuits

All refrigerant circuits fear contamination from dust and moisture. If such pollutants introduced into refrigeration circuit, they can contribute to degrade the reliability of the heat pump.

- It's necessary to ensure correct containment connections and refrigerant circuits (hydraulic unit, outdoor unit).
- In case of subsequent failure and expertise, the finding of the presence of moisture or foreign objects into the compressor oil would lead to systematic exclusion of warranty.
- Check upon receipt that the fittings and the refrigeration circuit caps mounted on hydraulic unit and outdoor unit are properly seated and locked (impossible to loosen bare hands). If this's not the case, tighten them using an against wrench.
- Check also that the refrigerant connections are sealed (plastic caps or tubes crushed at the ends and soldered). If the caps must be removed during installation (tubes cut by example), put back them as soon as possible.

2.2.4 Accessories provided

Accessories provided with the outdoor unit (figure 9). Accessories provided with the hydraulic unit (figure 10).

2.3 Installation position

The choice of the position for installation is particularly important insofar as any later movement is a delicate operation requiring the intervention of a qualified person.

Choose the site of the outdoor unit and the hydraulic unit after discussion with the customer.

Observe the maximum and minimum distances between the hydraulic unit and the outdoor unit (figure 17, page 17), the guarantee of the performances and the system's service life depend on this.

figure 9 - Accessories provided with the outdoor unit

figure 10 - Accessories provided with the hydraulic unit

2.4 Installation of the outdoor unit

2.4.1 Installation precautions

- The outdoor unit must only be installed outdoor (outdoors). If a shelter is required, it must have broad openings on the 4 walls and observe the installation clearances (figure 11).
- Choose a site that is preferably sunny and sheltered from strong cold predominant winds (mistral, tramontana, etc...).
- The unit must be easily accessible for future installation and maintenance work (figure 11).

- Ensure that it is possible to make the connections to the hydraulic unit easily.
- The outdoor unit is able to withstand bad weather but avoid installing in a position where it is likely to be exposed to significant dirt or flowing water (under a defective gutter for example).
- Water may drain away from the outdoor unit when it is operating. Do not install the appliance on a paved terrace; choose a well-drained place (e.g. gravel or sand). If the installation is in an area where the temperature can be lower than 0°C for a long period, check that the presence of ice does not present any danger. A drainage pipe can also be connected to the outdoor unit (figure 12, page 14).

figure 11 - Minimum installation clearances around outside unit (all models)

- Nothing should obstruct the air circulation through the evaporator and from the fan (figure 11).
- Keep the outdoor unit away from heat sources and inflammable products.
- Make sure the appliance not disturb the surrounding area or users (noise level, draught generated, low temperature of the air being blown out, with the risk of freezing plants in its path).
- The surface on which the appliance is installed must:
- be permeable (soil, gravel, etc),
- support its weight easily,
- provide a solid fixing and
- not transmit any vibration to the dwelling. (Anti-vibratory blocks are available as an option).
- The wall bracket can not be used in conditions likely to transmit vibrations, ground position is preferred.

2.4.2 Outdoor unit positioning

The outdoor unit must be raised at least 50 mm above ground level. In areas prone to snow, this height should be increased but should not exceed 1,5 m (figure 12).

- Fasten the outdoor unit by means of screws and rubber tightening or toothed lock washers to avoid their coming loose.

Warning

In the area with heavy snowfall, if the intake and outlet of outdoor unit is blocked with snow, it might become difficult to get warm and it is likely to cause of the breakdown.

Please construct a canopy and a pedestral or place the unit on high stand (local configured).

- Set the unit on a strong stand, such as one made of concrete blocks to minimize shock and vibration.
- Do not set the unit directly on the ground because it will cause trouble.

2.4.3 Condensate drain hose

(see figure 12)

If the use of a discharge pipe is imperative:

- Use the elbow provided (C) to connect a 16mm-diameter hose for draining away the condensate.
- Use the stopper or stoppers provided (**B**) to block the opening of the condensate tank.

Allow for the condensate to flow away under the force of gravity (waste water, rain water, gravel bed).

If the installation is made in an area where the temperature can be lower than 0°C for a long period, provide the drain pipe with a trace resistance to avoid it icing up. The trace resistance must heat not only the pipe but also the bottom of the appliance's condensate collection tank.

figure 12 - Positioning of the outside unit, draining away the condensate

figure 13 - Removing the cover

2.5 Installing the hydraulic unit

2.5.1 Installation precautions

- The room in which the appliance operates must comply with the prevailing regulations.
- To facilitate maintenance and to allow access to the various components, we recommend that you provide sufficient space all around the hydraulic unit (figure 14).
- Be careful not to bring inflammable gas near to the heat pump during its installation, in particular when it requires brazing. The appliances are not fireproof and should therefore not be installed in a potentially explosive atmosphere.
- To avoid condensation inside the condenser, remove the refrigerant circuit caps only when building the refrigerant connections.
- If the refrigerant connection only occurs at the end of the installation, be sure that the refrigerant circuit caps* remain in place and tight throughout the installation duration.
 - * (hydraulic unit side and outdoor unit side)
- After every intervention on the refrigeration circuit and before final connection, take care to replace the plugs in order to avoid any pollution from the refrigeration circuit (The sealing with tape is prohibited).

figure 14 - Minimum installation clearances around the hydraulic module and distances to the combustible partitions

2.6 Refrigeration connections

This appliance uses refrigerant R410A.

Comply with the legislation for handling refrigerants.

2.6.1 Rules and precautions

 After every intervention on the refrigeration circuit and before final connection, take care to replace the plugs in order to avoid any pollution from the refrigeration circuit.

Minimum necessary tools

- Set of manometers (*Manifold*) with hoses exclusively reserved for HFCs (Hydrofluorocarbons).
- Vacuum gauge whith isolation valves.
- Vacuum pump specially for HFCs (use of a traditional vacuum pump is authorized if, and only if, it is fitted with a non-return valve on the suction side).
- Flaring tool.
- Pipe-cutter.
- Deburring tool.
- Wrenches.
- Refrigerant gas leak detector certified (sensitivity 5g/year).
- Provision on using tools that have been in contact with HCFCs (R22 for example) or CFCs.
- The manufacturer declines any liability with regard to the guarantee if the above instructions are not observed.

Flared connections

- Lubrication with mineral oil (for R12, R22) is forbidden.
- Only lubricate with polyolester refrigeration oil (POE). If POE is not available, fit without lubrication.

Brazing on the refrigeration circuit (if necessary)

- Silver brazing (40% minimum recommended).
- Brazing only under dry nitrogen internal flux.
- To eliminate any filings in the pipes, use dry nitrogen to avoid introducing any humidity that may adversely affect the appliances operation. In general, take every precaution to avoid humidity penetrating into the appliance.
- Proceed to insulate the gas and liquid pipes to avoid any condensation. Use pipe insulators resistant to temperatures over 90°C. In addition if the humidity level in areas where the refrigeration pipes are installed is expected to exceed 70%, protect the pipes with pipe insulators. Use an insulating material thicker than 15mm if the humidity level is 70~80%, and an insulating material thicker than 20mm if the humidity exceeds 80%. If the recommended thicknesses are not observed under the conditions described above, condensation will form on the surface of the insulation material. Lastly, take care to use pipe insulators

whose thermal conductivity is 0.045 W/mK or less when the temperature is 20°C. The insulation must be impermeable to resist the passage of steam during the defrosting cycles (fibreglass wool is prohibited).

2.6.2 Refrigeration connections

The outdoor unit must be connected to the hydraulic unit only with copper pipes and connections (refrigeration quality), insulated separately.

Comply with the pipe diameters and the permitted pipe lengths (figure 17).

The minimum length of the refrigeration connections is 5 m for correct operation.

The appliance will be excluded from guarantee if it is used with refrigeration connections less than 5 m long.

If the refrigeration connections are exposed to weathering or UV- and the insulation is not strong, it is necessary to provide protection.

Manipulate the pipes and take them through walls with protective plugs in place.

2.6.3 Creating the flarings

- Cut the pipe to an appropriate length with a pipe-cutter without deforming it.
- Carefully deburr it, holding the pipe towards the bottom to avoid introducing filings into the pipe.
- Remove the flared connection nut situated on the valve to be connected and slip the pipe into the nut.
- Proceed to flare, letting the pipe overflow the flaring tool.
- After flaring, check the condition of the working radius (L). This must not show any scratch or trace of any fracturing. Also check the dimension (B).

2.6.4 Shaping the refrigeration pipes

The refrigeration pipes must be shaped only on a bending machine or with a bending spring in order to avoid any risk of crushing or breaking them.

Warning!

- Remove the insulation material locally to bend the pipes.
- Do not bend the copper to any angle over 90°.
- Never bend pipes more than 3 times in the same position otherwise traces of fracturing may appear (from strain-hardening the metal).

ø Hose	dimensions in mm				
<i>р</i> поѕе	L	B ⁰ / _{-0,4}	С

Plug (A) 1/2"	25 to 30 Nm
Plug (A) 5/8"	30 to 35 Nm
Plug (B) 3/8", 5/8"	10 to 12 Nm
Plug (B) 1/2", 1/4"	12,5 to 16 Nm

figure 16 - Tightening torque

2.6.5 Connecting the flared connections

- Connections must be made the day of the filling the installation with gas (see para. 2.7, page 18).
- Take particular care positioning the tube opposite its connector so as not to risk damaging the threads. A carefully aligned connector can be fitted easily by hand without much force being required.
- The refrigeration circuit is very sensitive to dust and humidity: check that the area around the connection is clean and dry before removing the plugs protecting the refrigeration connectors.
- Depending on the case, connect an adapter (reducer) 1/4"- 3/8" or 1/2"- 5/8" (see figure 17).
- Remove the plugs from the pipes and the refrigeration connections.
- Present the pipe to the flared connector and screw the nut by hand while holding the connector with a wrench until contact.
- Comply with the indicated tightening torques.

figure 17 - Connecting the flared connections (Pipe diameters and permissible lengths)

Filling the installation with gas 2.7

- This operation is reserved for installers familiar with the legislation for handling refrigerants.
- Creating a vacuum with a vacuum pump is essential (see ANNEX 1).
- Never use equipment used beforehand with any refrigerant other than a HFC.
- Remove the refrigerant circuit caps only when building the refrigerant connections.
- Unfavorables conditions:
 - If the outdoor temperature is between +5 and
 - +10 °C, it's obliged to have a vacuum gauge for validate the pump down operation and use method 3 empty. (see ANNEX 2).
 - If the outdoor temperature is below +5 °C, it's strongly not recommended to do the filling the installation with gas.

ANNEX 1

Method for calibration and control of a vacuum pump

Clogged

gauge

Vacuum

pump

- Check the oil level of the vacuum pump.
- Connect the vacuum pump with the vacuum gauge according to the scheme.
- Pump down during 3 minutes.
- After 3 minutes, the pump reaches its threshold value and the vacuum gauge needle does not move.
- Compare the obtained pressure with the value of the table. Depending on the temperature, this pressure must be less than the value indicated in the table.
- => If it's not the case, replace the gasket, flexible hose or the pump.

T °C	5°C <t<10°c< th=""><th>10°C<t<15°c< th=""><th>15°C < T</th></t<15°c<></th></t<10°c<>	10°C <t<15°c< th=""><th>15°C < T</th></t<15°c<>	15°C < T

- mbar	9	15	20

ANNEX 2

Method 3 empty

- Connect the high pressure hose to the Manifold, ("Gas" connection). A valve must be mounted on the flexible hose from the vacuum pump in order to isolate it.
- a) Pump down to the desired value (see table ANNEX 1),

b) Stop the vacuum pump, close the valve end of the service hose (yellow). Connect the hose to the expansion valve of the nitrogen bottle, inject 2 bars, close the flexible hose valve,

c) Reconnect the flexible hose to the vacuum pump, turn on and gradually open the hose valve.

- d) Repeat this at least three times.
 - Reminder: It's strictly forbidden to perform these operations with refrigerant.

2.7.1 Commissioning procedure

Check before connecting

"Gas" connection control (large diameter).

- Connect the "Gas" connection to the outdoor unit.
- Blow dry nitrogen into the "Gas" connection and observe this end:
- · If water or impurities emerge, use a new refrigerant connection.
- · Otherwise, perform the flare and connect immediately the refrigerant connection to the hydraulic unit.

"Liquid" connection control (small diameter).

- Connect the "Liquid" connection to the outdoor unit.
- Blow dry nitrogen into "Gas" connection condensor - "Liquid" connection assembly and Observe this
- end (Outdoor unit side).
- · If water or impurities emerge, use a new refrigerant connection.
- · Otherwise, perform the flare and connect immediately the refrigerant connection to the outdoor unit.

First seal test

- Remove the protective plugs (**B**) from the charging hole (*Schrader*) in the "Gas" valve (large diameter).
- Connect the high pressure hose to the Manifold.
- Connect the bottle of nitrogen to the Manifold (Use only dry nitrogen type U)
- Pressurize the refrigerant circuit with nitrogen (10 bar maximum) ("Gas" connection – condensor - "Liquid" connection assembly).
- Let the circuit under pressure for 30 minutes.

 Search for leaks with a leak detector product, repair and repeat the test.

- When the pressure is stable and leakage is excluded, drain nitrogen letting a pressure above atmospheric pressure (0,2 to 0,4 bar).
- Creating a vacuum and filling the refrigeration connections with gas
- If necessary, calibrate the Manifold gauge to 0 bar.
 Adjust the vacuum gauge to the atmospheric pressure (around 1013 mbar)
- Connect the vacuum pump to the *Manifold*. Connect a vacuum gauge if the vacuum pump is not equipped.

- Create a vacuum until the residual pressure* in the circuit falls below the value given in the following table. (* measured with the vacuum gauge)

T °C	5°C <t<10°c< th=""><th>10°C<t<15°c< th=""><th>15°C < T</th></t<15°c<></th></t<10°c<>	10°C <t<15°c< th=""><th>15°C < T</th></t<15°c<>	15°C < T
Pmax - bar - mbar	0.009	0.015 15	0.020

figure 18 - Connexion of the hose on the "Gaz" valve

- Let the pump continue to operate for another 30 minutes minimum after reaching the vacuum.
- Close the *Manifold* valve and then stop the vacuum pump without disconnecting any of the hoses in place.
 - If the outdoor temperature is between +5 and +10 °C, use method 3 empty (see ANNEX 2)
- Remove the access plugs (A) from the valve controls.
- First of all fully open the "Liquid" valve (small) and then the "Gaz" valve (large) using a hex key (counterclockwise direction) without forcing excessively against the stop.
- Remove the hose rapidly to the *Manifold*.
- Refit the 2 original caps (be sure they are clean) and tighten them to the recommended tightening torque. The sealing is performed in the caps only metal to metal.

The outdoor unit does not contain any additional refrigerant, enabling the installation to be purged.

Flushing is strictly forbidden.

2.7.2 Sealing test

Once the refrigeration circuit has been gassed as described above, check that all the refrigeration connectors are gas-tigh (4 connectors).

The sealing test must be performed with an approved gas detector. If the flarings have been made correctly, there should be no leaks.

- Bring the gas into the outdoor unit (pump down). The pressure should not drop below atmospheric pressure (0 bar to read on *Manifold*) so as not to contaminate the recovered gas with air or moisture.
- Make the connection again.
- Repeat the commissioning procedure.

2.8 Hydraulic connecting

2.8.1 General

The connection must comply with good trade practice according to local building regulations.

The heating circulating pump is built into the hydraulic unit. Connect the central heating pipes to the appliance, complying with the direction of circulation.

The pipe between the heat pump and the heat collector must be at least one inch in diameter (26x34 mm).

Calculate the diameter of the pipes according to the flow rates and the lengths of the hydraulic systems.

Tightening torque: 15 to 35 Nm.

Use union connectors to facilitate removing the hydraulic unit.

Preferentially use connection hoses to avoid transmitting noise and vibrations to the building.

Connect the drains from the drain valve and the safety valve to the main sewer system.

Verify the correct functioning of the expansion system. Control the vessel pressure and the safety valve setting.

Reminder: Seal everything when fitting in accordance with prevailing trade practice for plumbing work:

- Use suitable seals (fibre seals, o-rings).
- Use Teflon tape or hemp.
- Use sealing paste (synthetic depending on the case).

The use of glycol is not necessary. If you are using a glycol/water mix, provide for an annual check on the quantity of glycol. Use monopropylene glycol only. **Never use monoethylene glycol.**

- In certain installations, the presence of different metals can cause corrosion problems; the formation of metal particles and sludge in the hydraulic circuit is then seen.
- In this case, it is advisable to use a corrosion inhibitor in the proportions indicated by its manufacturer.
- Please refer to the chapter "Treatment of domestic and heating water" in our price catalogue.
 - It is also necessary to ensure that the treated water does not become aggressive.

figure 19 - Overall hydraulic layout

2.8.2 Connecting to the DHW circuit

On the cold water inlet, place a safety unit rated (from 7 to 10 bars - required by local regulations) and connected to a drain pipe leading to the sewers. Operate the safety unit according to manufacturer's specifications.

Connect the safety valve evacuation to the drain.

We recommend that a thermostatic mixer be placed on the hot water outlet.

2.8.3 Rinsing out the installation

Before connecting the hydraulic unit to the installation, rinse out the heating system correctly to eliminate any particles that may affect the appliance's correct operation.

Do not use solvents or aromatic hydrocarbons (petrol, paraffin, etc.).

In the case of an old installation, provide a sufficiently large decanting pot with a drain on the return from the boiler and at the lowest point in the system in order to collect and remove the impurities.

Add an alkaline product to the water and a dispersant.

Rinse the installation several times before filling it definitively.

2.8.4 Filling and purging the installation

Check the pipe fixings, the tightness of the connectors and the stability of the appliance.

Check the direction in which the water is circulating and that all the valves open.

Proceed to fill the installation.

Do not operate the circulating pump while filling. Open all the drain valves in the installation and the bleeder valve for the hydraulic unit (**P**) to remove the air contained in the conduits.

Close the drain and bleeder valves and add water until the pressure in the hydraulic circuit reaches 1 bars.

Check that the hydraulic circuit has been purged correctly. Check there is not a leak.

After the "Start-up" stage (see page 28), once the machine has started, purge the hydraulic unit again (2 litres of water).

Precise filling pressure is determined by the manometric height of the installation.

figure 21 - Hydraulic module bleeder valve

2.8.5 Connecting the Fan convector circuit

Heat pump > 11 kW: It must be installed on this circuit a buffer tank (minimum capacity: 50 liters).

Legend:

- 1. Liquid refrigeration connection.
- 2. Gas refrigeration connection .
- 3. Heating return (1 circuit).
- 4. Heating flow (1 circuit).
- 5. Stop valve (not supplied).
- 6. DHW exit (domestic hot water).
- 7. DCW entry (domestic cold water).
- 8. Shut-off (not supplied).
- 9. Filling.
- 10. Safety unit (not supplied).
- 11. Connecting to the drain with the siphon.
 - Bleed tap evacuation.
 - Safety valve evacuation.

figure 20 - Connections

2.9 Heating circulation pump speed settings

figure 23 - Hydraulic pressures and flow rates available

figure 22 - Pump dial

Circulation pump sticking or blocked:

If the motor is blocked, a start cycle is launched.

If the motor remains blocked it will be permanently stopped.

Cut off the electricity supply from the circulation pump for 30 seconds in order to release and authorise another start cycle.

2.10 Electrical connections

Ensure that the general electrical power supply has been cut off before starting any repair work.

2.10.1 Characteristic of the electrical supply

The electrical installation must be conducted in accordance with the prevailing regulations.

The electrical connections must only be made when all the other fitting operations have been completed (fixing, assembly, etc.).

The contract concluded with the energy provider must be sufficient not only to cover the heat pump's power but also the combined sum of all the appliances likely to be operating at the same time. When the power is too low, check with your energy provider the value subscribed to in your contract.

Never use a socket for the power supply.

The heat pump must be supplied with power by special protected leads from the electric panel via 2-pole circuit breakers specially dedicated to the heat pump, Curve D for the outdoor unit, curve C for the electrical heating and domestic water back-ups (see tables on page 24).

The electrical installation must necessarily be equipped with a 30mA differential protection.

This appliance is designed to operate under a nominal voltage of 230 V +/- 10%, 50 Hz.

2.10.2 General remarks on electrical connections

It is essential to maintain the live-neutral polarity when making the electrical connections.

Tighten the screws on the terminal blocks perfectly. Unsufficient tightening can cause overheating, leading to breakdown or even a fire.

Tighten the cables using the cable glands to prevent the conductors from disconnecting accidentally.

Connection to Earth and Earth bonding continuity are essential.

Connecting to screw terminals:

Rigid wires (A)

Rigid wires are always preferable for fixed installations, particularly in a building.

- Always select a wire that complies with the prevailing standards.
- Strip away around 25 mm from the end of the wire.
- With round end pliers, form a loop with a diameter corresponding to the tightening screws on the terminal.
- Tighten the terminal screw firmly onto the loop created.

Flexible wires (B)

H07RNF type (or superior quality) flexible wire can be used with certain precautions:

- Strip away around 10 mm from the end of the wire.
- With tightening pliers, fit a round tag with a diameter corresponding to the terminal screw's diameter on the end of the wire.
- Tighten the tag firmly onto the terminal with a screwdriver. We strongly advise against using flexible wires without round tags.
- Always protect the cables when passing them through cable clamps with PVC protective conduit 0,5 to 1 mm thick.

· Connecting to regulation cards:

Remove the corresponding connector and make the connection.

· Connecting to spring terminals:

Rigid wires:

- Strip away around 10 mm from the end of the wire.
- Slide the wire into the opening provided for this purpose.
- Push the spring with a screwdriver so that the wire enters the cage.
- Remove the screwdriver and then check that the wire is jammed in the cage by pulling on it.

Flexible wires:

- Use the ends and proceed as before.

2.10.3 Overview of all the electrical connections

The wiring diagram for the hydraulic unit is shown in detail on figure 39, page 50.

figure 24 - Overall layout of the electrical connections for a simple installation (1 heating circuit)

2.10.4 Cable section and protection rating

The cable sections are given for information purposes only and do not exempt the installer from checking that these sections correspond to the requirements and comply with the prevailing standards.

• Power supply to outdoor unit:

Heat p	ump (HP)	Electricity sup	ply 230 V - 50 Hz
Model Maxi. power absorbed		Cable connection (phase, neutral, earth)	Curve D circuit breaker size
extensa duo 5 & 6 3450 W		3 x 1,5 mm²	16 A
extensa duo 8 & 10 3910 W		3 x 2,5 mm²	20 A

- Interconnection between the outdoor unit and the hydraulic unit: The hydraulic unit is powered by the outdoor unit by means of a cable with 4 x 1,5 mm² (phase, neutral, earth, communication bus).
- **Electricity supply DHW:** The DHW section is powered directly via a 3 x 1,5 mm² cable (phase, neutral, earth). Protection by circuit breaker (16 A, curve C).
- Power supply to the electrical back-ups (option):

The hydraulic unit contains two stages of electrical back-ups installed in a heat exchange tank.

Heat pump (H	P)	Electrical back-ups		Power supply to the electrical back-ups	
Model		Power	Nominal current	Cable connection (phase, neutral, earth)	Curve C circuit breaker size
extensa duo 5, 6, 8 & 10		2 x 3 kW	26,1 A	3 x 6 mm²	32 A

Ensure that the general electrical power supply has been cut off before starting any repair work.

2.10.5 Electrical connections on the outdoor unit side

Access to the connection terminals:

- Remove the front panel, remove the cap (figure 25).
- Make the connections in accordance with the diagram figure 26.
- Use cable clamps to prevent the conductors from being disconnected accidentally.
- Use the mounting plate to hold the cables against the insulating plate (ref. 1 to 3, figure 27). Secure cables so that they are not in contact with pipes and valves (ref. 4).

figure 25 - Access to outside unit's terminal block

figure 26 - Connections to outside unit's terminal block

figure 27 - Finalisation of connection to outside unit

2.10.6 Electrical connections on the hydraulic unit side

Access to the connection terminals:

- Remove the front panel.
- Open the power control box.
- Make the connections in accordance with the diagram figure 30.

Do not place the sensor lines and the sector supply lines in parallel in order to avoid interferences due to voltage points in the sector supply.

Ensure that all the electrical cables are housed in the spaces provided for this purpose.

Interconnection between the outdoor unit and the hydraulic unit:

Comply with the correspondence between the markings on the hydraulic unit's terminals and those on the outdoor unit when connecting the interconnection cables.

A connection error could cause the destruction of one or other of the units.

• Electrical back-ups (option):

If the heat pump is not installed with a boiler connection:

- Connect the electrical supply for the back-ups to the electrical panel.

• Boiler connection (option):

- If the boiler connection option is used, the electric boost option must not be connected.
- Please refer to the instructions supplied with the boiler connection kit.
- Please refer to the instructions supplied with the boiler.

· Second heating circuit:

- Please refer to the instructions supplied with the second circuit kit or/and Regulation extension kit.

• Contract with the power provider:

The heat pump's operation can be controlled to suit special contracts (e.g. off-peak, day/night). In particular, domestic hot water (DHW) at Nominal temperature will be produced during the off-peak hours when electricity is cheaper.

- Connect the "Power Provider" contact to input EX2.
- Set the parameter (1620) to "Off-peak hours".
- 230V on input EX2 = "Peak hours" information activated (Base setting / Line modification possible 5983, Configuration menu).

• Power shedding or EJP (peak day removal):

Power limitation is intended to reduce electrical consumption when this is too high compared to the contract with the power provider.

- Connect the power limiting device to input EX1, the back-ups for the heat pump and the DHW stop in the event of over-consumption by the dwelling.
- 230 V on input EX1 = power limitation in progress (Base setting / Line modification possible 5981, Configuration menu) (Operating line 2920).

• External faults the heat pump:

Any component of carryforward of information (thermostat, pressure switch, etc.) may signal an external problem and stop the heat pump.

- Connect the external component to input EX3.
- 230 V on input EX3 = stoppage of heat pump (the system displays Error 369).
- In the case of a heated floor, connect the floor heating safety device into the connector of the floor heating pump (X12 or X110).

figure 28 - Access to hydraulic model electric box and description

figure 29 - Connection to terminal block and power relays

figure 30 - Connections to the heat pump regulator (accessories and options)

2.11 Outdoor sensor

The outdoor sensor is required for the heat pump to operate correctly.

Consult the fitting instructions on the packaging.

Place the sensor on the coldest part, generally the northern or north-eastern side.

In any case, it must not be exposed to the morning sun. It must be installed so as to be easily accessible but at least 2,5 m from the floor.

It is essential that it avoid any sources of heat such as flues, the upper parts of doors and windows, proximity to extraction vents, the underneath of balconies and under-eave areas, which would isolate the sensor from variations in the outdoor air temperature.

- Connect the outdoor sensor to the connector **X84** (terminals **M** and **B9**) on the heat pump control board.

2.12 Room thermostat and/or room control unit

The room thermostat (room control unit) is optional.

Consult the fitting instructions on the packaging.

The sensor must be installed in the living room area on a very uncluttered wall. It must be installed so as to be easily accessible.

Avoid direct sources of heat (chimney/flue, television, cooking hobs), draughty areas (ventilation, door, etc.).

Air leaks in the seals in the constructions are often translated into cold air blowing through the electrical conduits. Lag the electrical conduits if there is a cold draught on the back of the IR sensor.

2.12.1 Installing a room sensor

• Room thermostat T37:

- Connect the sensor to the **X86** connector of the heat pump's regulator board using the connector provided (terminals **B2**, **M** and **B1**).
- In the case of 2 heating circuits, The sensor is connected to the card which corresponds to the regulated heating circuit.

• Room thermostat T55:

- Connect the sensor to the **X86** connector of the heat pump's regulator board using the connector provided (terminals **1**, **2**).
- Room thermostat radio T58:
- Connect the wireless room thermostat radio to the connector **X60**.

2.12.2 Installing a room control unit

• Room control unit T75:

- Connect the sensor to the **X86** connector of the heat pump's regulator board using the connector provided (terminals **1**, **2** and **3**).

• Room control unit radio T78:

- Connect the wireless room control unit radio to the connector **X60**.

2.13 Commissioning

- Close the installation's main circuit breaker.

On first commissioning (or in winter), in order to allow the compressor to pre-heat, engage the installation's main circuit breaker (power supply to the outdoor unit) some hours before starting up the tests.

- Engage the start/stop switch.

To ensure that inputs EX1, EX2 and EX3 operate correctly: Check that the live-neutral polarity of the electrical supply is correct.

When the power is switched on and every time that the ON/OFF button is switched off and then switched on again, the outdoor unit will take approximately 4 minutes to start up, even if the setting is requesting heating.

The display can show error 370 when the appliance (re)starts. Do not be concerned, the communication between the outdoor and hydraulic unit will re-establish itself in a few moments.

During the regulator initialisation phase, the display shows all the symbols and then "Data, update" and then "State heat pump"

- Make all the specific adjustments to the setting. (Installation configuration):
- Press $\stackrel{\circ \kappa}{\triangleright}$.
- Hold down the key of for 3s and select the level of access used with the aid of the knob.
- Confirm with the key $\bigcap^{\circ k}$
- Parameter the heat pump's setting (Consult the settings' list page 35).

On commissioning (or the case of error 10), the electrical back-up heaters are liable to start up even if the outdoor temperature at the time is above the heaters' trigger temperature.

The regulating system uses an average initial outdoor temperature of 0°C and requires some time to update this temperature.

To avoid this situation, the sensor must be connected correctly. Re-initialise parameter 8703 (commissioning level, consumer diagnostic menu).

2.14 Configuring room thermostat (T55 or T58)

To configure the room thermostat and connect it to the appropriate heating zone:

- Hold down the presence key for more than 3 seconds.
 The room thermostat displays RU and a number flashes
- Turn the wheel to choose the zone (1, 2).
- If the installation is fitted with 2 room thermostats,
- First connect one room thermostat and configure it in zone 2,
- Then connect the other room thermostat and configure it as default in zone 1.
- Hold down the presence key; the room thermostat displays P1 and a flashing number.

 1: Automatic recording: a correction of the setting with the button is adopted without any particular confirmation (timeout) or by pressing the mode key.

 2: Recording with confirmation: a correction of the setting with the button is not adopted until the mode key is pressed.
- Press the presence key again; the room thermostat displays P2 and a flashing number.

0: OFF: all the operating elements are engaged.

- 1: ON: the following operating elements are locked:
 - Switching over the heating circuit's operating mode.
 - Adjusting the comfort setting,
 - Changing the operating level.

The room thermostat displays OFF for 3 seconds when a locked button is pressed.

2.15 Configuring room control unit (T75 or T78)

During commissioning, after an initialisation period of approx. 3 minutes, the user's language must be set:

- Press \bigcirc° .
- Choose menu "Operator section".
- Choose language.
- Select the language (**English**, Deutsch, Français, Italiano, Nederlands, Español, Português, Dansk...).

In the case of 2 heating circuits:

- Choose the allocation of the room control unit (room appliance 1 or 2...) line **40*** (see page 34).
- According to the allocation selected check and, if necessary, modify the settings for lines **42***, **44***, **48*** (see page 34).

Line		Function	Setting range or display	Setting increment	Basic setting

2 0.5 C temperature ambiante	- Room temperature / Setpoint value.
temperature ambiante	- Setpoint information / Parameter Information.

3.3 Temperature control

The heat pump's operation is subject to the temperature control.

The set temperature for the water in the heating circuit is adjusted according to the outdoor temperature.

If there are thermostatic valves on the installation, these must be fully open or adjusted for higher than the normal set temperature.

3.3.1 Set to

During installation, the temperature control must be parametered according to the heat emitters and the dwelling's insulation.

The temperature control' curves (figure 33) refer to an ambient setting of 20°C.

The slope of the temperature control (parameter 720) determines the impact of the variations in the outdoor temperature on the initial heating temperature variations.

The higher the slope, the more a slight reduction in the outdoor temperature causes a significant increase in the flow water temperature in the heating circuit.

The off-set in the temperature control (parameter 721) modifies the initial temperature of all the curves, without modification of the slope (figure 34).

The corrective actions in the case of any inconvenience are detailed in the table (figure 35).

figure 33 - Heating curve slope (line 720)

figure 34 - Off-set of the heating curve (line 721)

figure 35 - Corrective actions in the case of discomfort

3.4 Parametering the setting

3.4.1 General

Only the parameters accessible to levels:

- **U** End user
- I Commissioning level
- S Engineer level

Are described in this document.

The access levels are specified in the second column of the table by means of the letters $\boldsymbol{U}, \boldsymbol{I}$ and \boldsymbol{S} .

The OEM parameters are not described and require a manufacturer's access code.

3.4.2 Setting parameters

- Choose the desired level.
- Scroll the menu list.
- Choose the desired menu.
- Scroll the function lines.
- Choose the desired line.
- Adjust the parameter.
- Check the setting by pressing OK.
- To return the menu, press ESC.

If no setting is made for 8 minutes, the screen returns automatically to the basic display.

3.4.3 List of function lines (settings, diagnosis, status)

4 Overall hydraulic layout

• Configuration 1: 1 heating circuit.

• Configuration 2: 2 heating circuits.

5 Electrical wiring diagrams

figure 37 - Electrical wiring of outside unit model extensa duo 5 & 6

figure 38 - Electrical wiring of outside unit model extensa duo 8 & 10

figure 39 - Electrical wiring, Hydraulic module (Except installer's connections)

6 Troubleshooting

Depending on whether the fault comes from the outdoor unit or the hydraulic unit, the fault may be indicated by the digital display or the diode on the interface cards.

6.1 Faults displayed on the hydraulic unit

Faults or breakdowns on the hydraulic unit are indicated by the display on the user interface.

The display shows the \triangle symbol.

Press the key for more details on the origin of the fault.

When the error has been resolved, the faults are reinitialised at zero automatically.

Hydraulic unit: Fault visible on the digital display.

Error number	Error description	Error location	Heat pump operation despite the error
-	No connection.	Failure to comply with room thermostat's polarity.	No
10	Outdoor sensor.	В9	Yes with OT = 0 °C
33	Heat pump initial temperature sensor error.	B21	Yes
44	Heat pump return temperature sensor error.	B71	Yes
50	DHW temperature sensor.	В3	Yes
60	Ambient temperature sensor 1.		Yes
65	Ambient temperature sensor 2.		Yes
105	Maintenance message.		Yes
121	Flow temperature for (HC1) not reached.		Yes
122	Flow temperature for (HC2) not reached.		Yes
127	Anti-legionella temperature not reached.		Yes
369	External fault (safety component).		No
370	Outside unit connection error. (In the start phase, see the para. "Start-up").	See below and page 53	No

Hydraulic unit: Flashing of the diode visible on the interface card.

Diodes display		Every contents
LED 2 (green)	LED 1 (red)	Error contents
1 Flash	1 Flash	Communication error between Hydraulic unit and Outdoor unit.
4 Flashes	1 Flash	Heat pump capacity signal error (Open or short).
4 Flashes	2 Flashes	Hydraulic unit heat-exchange thermistor Error.
6 Flashes	3 Flashes	Inverter error.
6 Flashes	4 Flashes	Active filter error.
7 Flashes	1 Flash	Discharge thermistor error.
7 Flashes	2 Flashes	Compressor thermistor error.
7 Flashes	3 Flashes	Heat-exchange thermistor (outlet / intermediate) error.
7 Flashes	4 Flashes	Outdoor thermistor error.
7 Flashes	7 Flashes	Heat sink thermistor error.
7 Flashes	8 Flashes	Expansion valve thermistor error.
8 Flashes	4 Flashes	Current sensor error.
8 Flashes	6 Flashes	Pressure sensor error / Pressure switch error.
9 Flashes	4 Flashes	Current trip.
9 Flashes	5 Flashes	Detection of compressor position error / Compressor start up error.
9 Flashes	7 Flashes	Outdoor unit fan motor error.
10 Flashes	1 Flashes	Discharge temperature protection.
10 Flashes	3 Flashes	Compressor temperature protection.
10 Flashes	5 Flashes	Low pressure abnormal.
Continuous flashing (1 sec On / 1 sec Off)	Pump down operation.
Continuous lighting	Off	Defrosting.

6.2 Faults displayed on the outdoor unit

To access the electronic board, you must remove the front (right-hand) facing from the outdoor unit. Faults are coded by diode flashes.

Outdoor unit, model AOYA18LALL (model extensa duo 5 & 6).

Diode display	Erroneous element
0,1 seconds lit and 0,1 seconds unlit.	Defective temperature sensor (see hydraulic module).
0,5 seconds lit and 0,5 seconds unlit.	Abnormal intensity detector error.
2 seconds lit and 2 seconds unlit.	Electric current circuit breaker error.
5 seconds lit and 5 seconds unlit.	Defective fan motor.
0,1 seconds lit and 2 seconds unlit.	Position of the compressor's rotor not detected.
5 seconds lit and 0,1 seconds unlit.	Abnormal PAM circuit voltage.
1 seconds lit and 0,1 seconds unlit.	Timer cut off.
2 seconds lit and 5 seconds unlit.	Abnormal compressor temperature.
5 seconds lit and 2 seconds unlit.	Active filter error.
Permanently lit.	Abnormal discharge temperature.

Outdoor unit, model AOYA30LBTL (model extensa 8). Outdoor unit, model AOYA36LBTL (model extensa 10).

Diode display	Erroneous element
0,1 seconds lit and 0,1 seconds unlit.	Defective temperature sensor (see hydraulic module).
0,5 seconds lit and 0,5 seconds unlit.	Defective IPM card.
2 seconds lit and 2 seconds unlit.	Electric current circuit breaker error.
5 seconds lit and 5 seconds unlit.	Defective fan motor.
0,1 seconds lit and 2 seconds unlit.	Position of the compressor's rotor not detected.
5 seconds lit and 0,1 seconds unlit.	Defective ACTPM card.
Permanently lit.	Abnormal discharge temperature.

Finsure that the general electrical power supply has been cut off before starting any repair work.

When the HP is not under tension, protection frost-free is not assured.

6.3 Information display

Various data can be displayed by pressing the info button.

Depending on the type of unit, configuration and operating state, some of the info lines listed below may not appear.

- Possible error messages from the error code list (see table, page 51).
- Possible service messages from the maintenance code list.
- Possible special mode messages.

- Various data (see below).

Designation	Line
Floor drying current setpoint .	-
Current drying day.	-
Terminated drying days.	-
State heat pump.	8006
State supplementary source.	8022
State DHW.	8003

Swimming pool temperature.	8900
Swimming pool temperature setpoint.	0900
Minimum remaining stop time for compressor 1.	-
Minimum remaining running time for compressor 1.	-

7 Maintenance of the installation

Ensure that the general electrical power supply has been cut off before starting any repair work.

7.1 Hydraulic checks

Warning: If frequent refills are required it is essential that you look for any leaks. If filling and re-pressurization are required, check what type of fluid has been used initially.

Recommended filling pressure: 1 to 2 bar (Precise filling pressure is determined by the manometric height of the installation).

Each year,

- Check the expansion vessel pressure (precharge 1 bar) and the correct functioning of the safety valve.
- Verify the safety unit on the cold water supply inlet. Make it work as prescribed by the manufacturer.
- Check the shut-off.
- Verify the correct functioning of the distribution valve.

7.2 Maintenance of the DHW tank

Maintenance of the tank must be undertaken once a year (The frequency may vary according to water hardness).

7.2.1 Emptying the hot water tank

- Remove the facade from the hydraulic unit.
- Close the cold water entry into the tank.
- Open a hot water tap and open the water tank emptying valve (ref. 1).

7.2.2 Descaling

- Empty the water tank.
- Remove the hood of the electrical back-up (ref. 2).
- Disconnect the electrical back-up.
- Unplug the ACI.
- Remove the hub cap (ref. 3).
- Remove the electrical back-up (ref. 4).
- Remove any limescale deposits that have built up inside the tank. It is best to let the scale stuck to the walls of the tank: it forms a protective layer.
- Gently remove any limescale deposit on the glove finger. Do not use any metal objects or chemical or abrasive products.
- Replace the joint of the electrical back-up (ref. **5**) each time it is dismantled.
- Replace the electrical back-up and carry out 'crossed' locking of the nuts.
- Replace the hub cap.
- Reconnect the electrical back-up.
- Plug in the ACI.
- Replace the hood of the electrical back-up.

figure 40 - Emptying the hydraulic unit and/or Domestic hot water tank

7.3 Checking the outdoor unit

- Dust off the heat exchanger if necessary, being careful not to damage the fins.
- Straighten the vanes using a comb.
- Check that there is nothing obstructing the passage of air.
- Check the fan.
- Verify that condensate drain is not obstructed.

· Checking the refrigeration circuit:

When the refrigerant charge is in excess of 2kg (8, 10, 13 and 16 models), it is compulsory to have an approved after sales service check the refrigeration circuit every year (with a certificate of capacity for the handling of refrigerants) (cf. para. 2.1, page 12).

- Check the lack of leak (connections, valves...).

7.4 Electrical checks

- Check connections and possible tightening.
- Check the cables condition and electronic boards.
- ACI light: In normal operation, the light flashes.

8 Maintenance

8.1 Emptying the hydraulic unit

- Remove the facade from the hydraulic unit.
- Place the distribution valve in the middle position.
- Open the emptying valve (ref. 6).
- Open the hydraulic unit's manual bleed-tap (ref. 7).
- Open the installation bleed tap.

8.2 Distribution valve

Carefully comply with the direction for fitting the distribution valve:

Channel AB: Inlet from the hydraulic unit (heat pump).

Channel A Open: Outlet to DHW tank.

Channel B Open: Outlet to the heating circuit.

8.3 ACI check

- Check polarity.
- Check voltage: The appliance powered on, the voltage value must be positive and lie between 0 + and + 6.5 V dc.

figure 41 - Fitting the distribution valve

ACI connecting:

The (-) on the tank mass.

The
on the electrode connector.

figure 42 - ACI check

9 Instructions for the user

Explain to the user how his installation operates, in particular the functions of the room thermostat and the programmes accessible to him from the user interface.

Emphasise that a heated floor has significant inertia and that therefore any adjustments must be made progressively.

Also explain to the user how to check the filling of the heating circuit.

10 Quick-start procedure

Before switching on the hydraulic unit:

- Check the electric wiring.
- Check the refrigeration circuit and make sure the gas supply has been performed.
- Check the pressure of the hydraulic circuit (1-2 bar), check that the heat pump is purged, and the rest of the installation

10.1 Start-up check-list

10.1.1 Before starting-up

Sight checks

Outdoor unit (see chapiter "Installation of the outdoor unit" page 12).		Non compliant	
Location and fittings, condensate evacuation.			
Compliance with distances from obstacles.			

Hydraulic checks

Hydraulic unit (see chapiter "Installing the hydraulic unit" page 15).	OK	Non compliant	Value
Connection of pipes, valves and pumps (1 or 2 circuits, DHW).			
Installation water volume (expansion vessel of adequate capacity ?).			
No leaks.			
Main system pressure and degassing (0,3bar > expansion vessel pre-loading).			

• Refrigeration connections and checks

(see chapiters "Refrigeration connections" page 16 and "filling the installation with gas" page 19).	OK	Non compliant	
Refrigerant circuits control (Sealing respected, no dust and moisture)			
Connections between units (pipe length, flare tightening torque).			
Installation of HP, LP pressure switches on "Gas" line (large pipe).			
Pump down required.			
Nitrogen leak test (~ 10 bar).			
Opening of refrigeration valves to outdoor unit.			
Refrigerant filling of hydraulic unit and pipes.			

• Electrical checks

Outdoor unit (see chapiter "Electrical connections" page 22).	OK	Non compliant	Value
Main power supply 230v.			
Protection by rated circuit breaker.			
Cable cross-section.			
Earth connection.			

Hydraulic unit (see chapiter "Electrical connections on the hydraulic unit side" page 25).	OK	Non compliant	
Connection with outdoor unit (phase, neutral, earth).			
Sensors connection (positioning and connections).			
3 way valve and circulators connections.			
Power supply and protection of electric auxiliary (option).			

10.1.2Starting-up

Quick start-up

(see chapiter "Star-up" page 28 "List of function lines (settings, diagnosis, status)", page 34).	OK	Non compliant	
Engage the installation's main circuit breaker (power supply to the outdoor unit) 2 hours before starting up the tests => Preheating of the compressor.			
Turn ON the start/stop switch => Initialisation for a few seconds.			
Operation of the circulation pumps.			
Outdoor unit starts after 4 mins.			
Time, Date and time programs for HC1, (HC2), DHW if different than default values (settings 500 – 576).			
Configure the hydraulic circuit (setting 5700).			
Ajust the heating curve slope (720; 1020).			
Adjust the maximum start setting (741 and 1041).			

• Outdoor unit checks

	OK	Non compliant	Value
Operation of fan(s), compressor.			
Current measurement.			
After a few minutes, measurement of air temp. delta.			
Check condensation and evaporation pressure/temperature.			

• Hydraulic unit checks

	OK	Non compliant	Value
After 15 mins of operation.			
Primary water temp. delta.			
DHW priority (switching of selection valve).			
Operation of heating, mixing valve, boiler backup,			

• Regulation system

(see chapiter "Configuring the room thermostat" page 28 and para. 3.4.3, page 34).	OK	Non compliant	
Settings, manipulations, checks.			
Set the scheduled periods for heating (500 to 516 / 520 to 536).			
Adjust the heating circuit setpoints if different than default values (710-714; 1010-1014).			
Adjust the DHW setpoints if different than default values (1610-1612).			
Setpoint display.			
Explanations on use.			

The heat pump is ready for operation!

Complies with

- Low voltage directive 2006/95/EC, under standard EN 60335-1.
- Electromagnetic compatibility Diretive 2004/108/EC,
- Directive 2006/42/EC Machinery,
- Directive for pressurised equipment 97/23/EC.

This appliance also conforms to:

- Regulation 842/2006 of the european parliament on certain fluorinated greenhouse gases.
- The standards relating to the product and the testing methods used: Air-conditioners, refrigeration units and heat pumps with compressor driven by electric motor for heating and refrigeration EN 14511-1, 14511-2, 14511-3, and 14511-4.
- To standard XP ENV 12102: Air-conditioners, heat pumps and dehumidifiers with compressor driven by electric motor. Measurement of airborne noise. Determination of acoustic power level.

This appliance is marked with this symbol. This means that electrical and electronic products shall not be mixed with general household waste. European Community countries(*), Norway, Iceland and Liechtenstein should have a dedicated collection system for these products. Do not try to dismantle the system yourself as this could have harmful effects on your health and on the environment.

The dismantling and treatment of refrigerant, oil and other parts must be done by a qualified installer in accordance with relevant local and national regulations.

This appliance must be treated at a specialized treatment facility for re-use, recycling and other forms of recovery and shall not be disposed of in the municipal waste stream. Please contact the installer or local authority for more information.

* subject to the national law of each member state
